FREE PILOT · TRY BEFORE YOU BUY

Know what is really on your OT segment — then decide whether Atlas is worth keeping.

Atlas OT Scout is a guided, offline assessment appliance for water and wastewater teams. We deliver it, help you run a bounded pilot, leave it with you, and let your own experience decide the purchase.

Current state → guided evidence → desired state

NO CLOUD · PASSIVE FIRST · BOUNDED ACTIVE CHECKS

The customer problem is not “lack of a scanner.”

It is the gap between what the organization thinks is on the segment and what it can actually defend today.

01 Inventory exists

But it may be stale, incomplete or inconsistent across spreadsheets, diagrams and field reality.

02 Visibility is fragmented

Passive evidence, physical checks and device identity data live in different tools and notes.

03 OT cannot be treated like IT

Broad discovery or uncontrolled probing can be inappropriate on a live process segment.

04 The final decision is still manual

Teams must decide what is known, what changed, what matters and what is still missing.

CUSTOMER BENEFIT **The real need is a trustworthy operating picture, not a bigger packet count.**

The desired state is simple: know, explain, act.

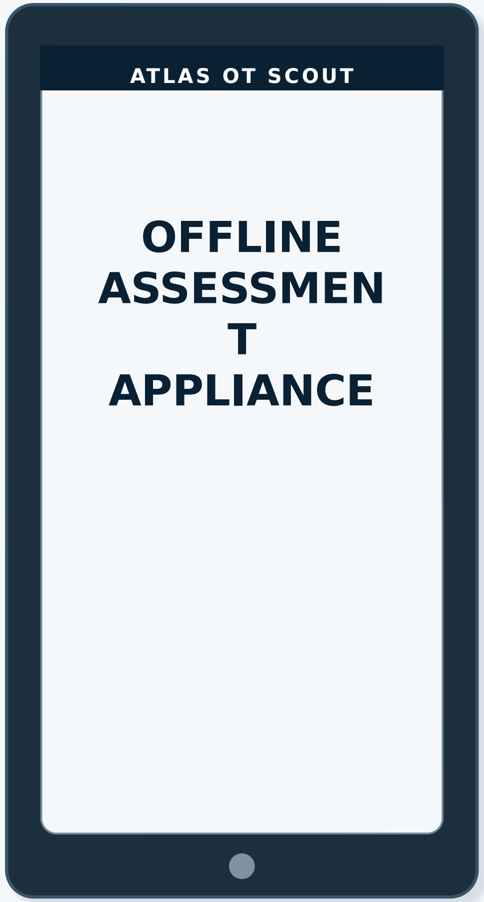
A good assessment leaves the customer with a defensible baseline and an explicit list of what still needs work.

CURRENT STATE		→	DESIRED STATE	
Expected assets	Records and diagrams		**Evidence-backed baseline**	Expected ↔ observed ↔ confirmed
Observed reality	Partial / ad-hoc evidence		**Known limitations**	Visibility and confidence stay explicit
Unknowns	Mixed into analyst notes		**Prioritized follow-up**	Findings tied to evidence
Next action	Depends on who is reviewing		**Repeatable method**	The appliance stays available for the next case

CUSTOMER BENEFIT **Confidence improves because every conclusion stays connected to evidence, scope and review — and missing evidence stays visible.**

You do not need to commit before you know whether the appliance helps.

Our commercial model is intentionally low-friction: use the capability first, then decide.



1 We deliver

A configured Atlas appliance for the agreed pilot scope.

2 You use it

We guide the first bounded assessment, then leave the device with your team.

3 You decide

Like the capability? Acquire it. Not useful? We pick it up.

4 We support

Add consulting, onboarding, review or support packages only when needed.

CUSTOMER BENEFIT **The customer learns the value on its own network before making a purchase decision.**

Atlas guides the customer from uncertainty to a defensible decision.

The application is organized around the decisions the operator must make — not around a list of scanning features.

1

Scope

What exact site, process area and decision are we supporting?

→

2

Collect

What is the least intrusive evidence that can close the gap?

→

3

Review

Which observations are strong enough to accept?

→

4

Reason

What changed, what conflicts and what needs follow-up?

→

5

Handoff

What is ready to sign off — and what is still blocked?

CUSTOMER BENEFIT **The workflow tells the operator what to do next and why — while preserving scope, safety and analyst judgment.**

Customer story: North Water Treatment Plant

The site has an expected inventory but one unresolved identity. The goal is to establish a current, defensible picture without broad discovery.

THE QUESTION

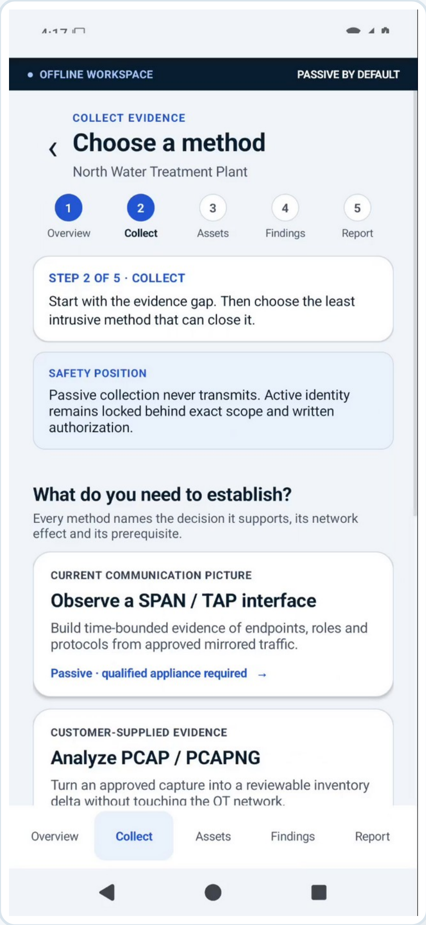
“Can we prove what is actually on this segment — and what still needs attention — without turning the assessment into a broad scan?”

- Watch the same problem move through scope, passive evidence, review, one bounded identity check and report readiness.

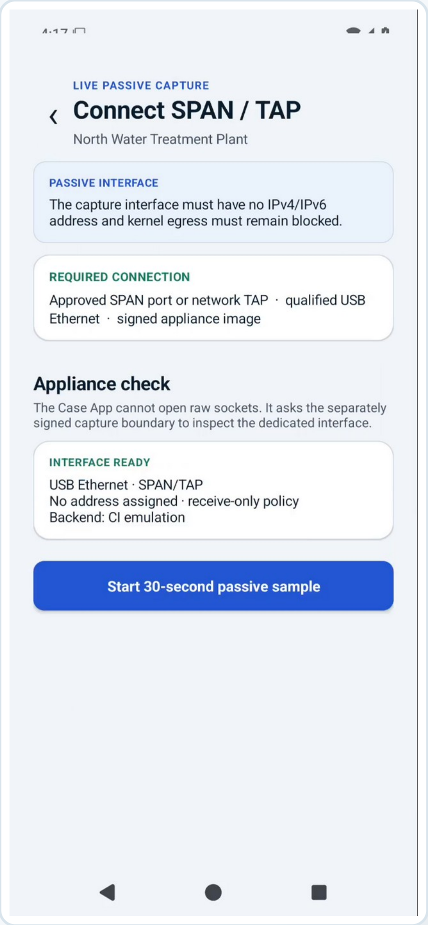
Video is embedded in the PowerPoint.

Step 1 — start passive and make the safest useful observation

Atlas guides the operator to the least intrusive evidence source before any active behavior is considered.



Choose the method



Verify receive-only capture

CUSTOMER PROBLEM

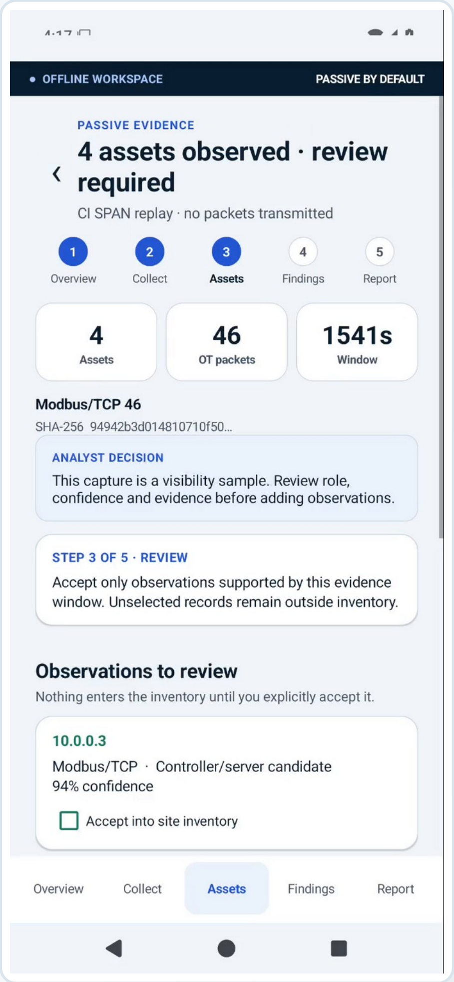
“I need a current communication picture, but I do not want a broad scan touching the process.”

- The app explains which method answers which question.
- SPAN / TAP is presented as the passive-first path.
- The appliance verifies the dedicated capture boundary before starting.

CUSTOMER BENEFIT **The customer gets useful visibility without making broad discovery the default.**

Step 2 — evidence is reviewed before it changes the inventory

The product separates “what was observed” from “what the customer is ready to accept as true.”



Passive evidence review

GUIDED REVIEW

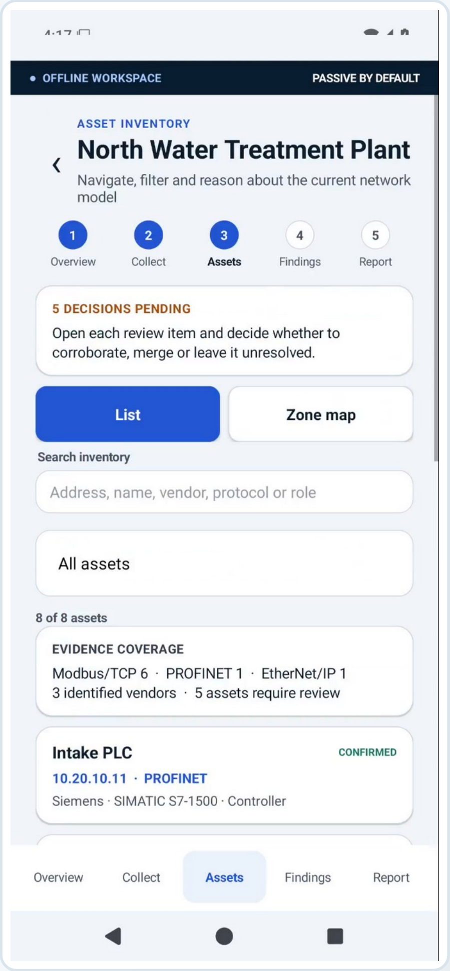
The capture produced four observed assets. Atlas does not silently turn them into inventory records.

✓ **Evidence stays attributable**	Hash, capture window, packet counts and method remain visible.
✓ **Confidence stays visible**	Role / identity inference is shown as evidence, not certainty.
✓ **The analyst decides**	Only explicitly accepted observations can enter the reviewed inventory.

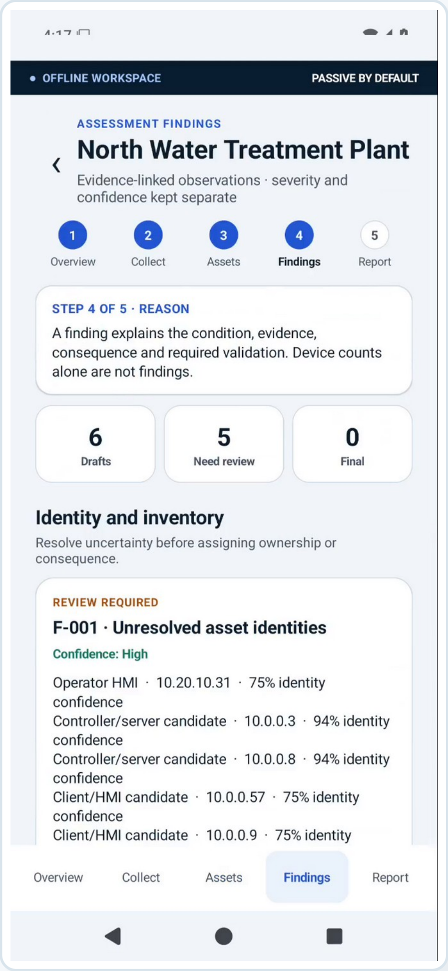
CUSTOMER BENEFIT **The customer reduces false assumptions because observations cannot silently become “truth.”**

Step 3 — reconcile what was expected with what was actually observed

The customer is guided to the delta that matters: confirmed, missing, unexpected or conflicting identities.



Reviewed inventory



Unresolved identity becomes work

FROM DATA TO DECISION

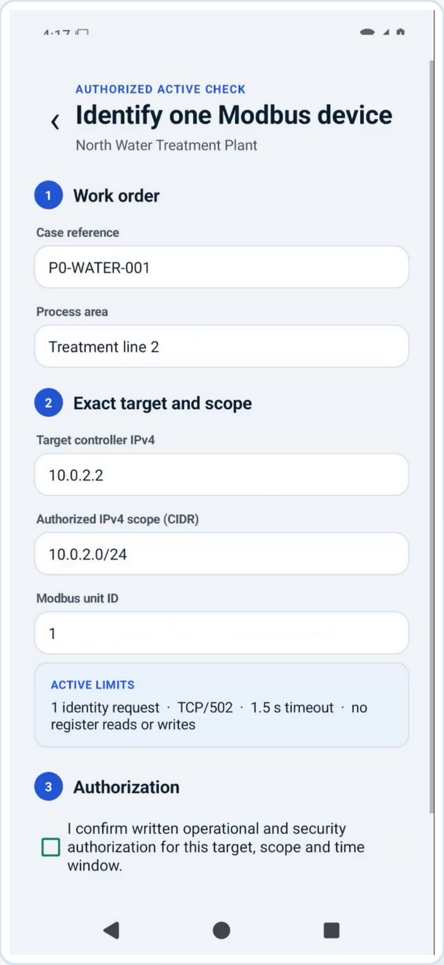
Atlas is not trying to maximize the number of discovered devices.

- Known records stay visible alongside new evidence.
- Unresolved identities stay visible instead of being guessed.
- The next recommended action is tied to the remaining uncertainty.

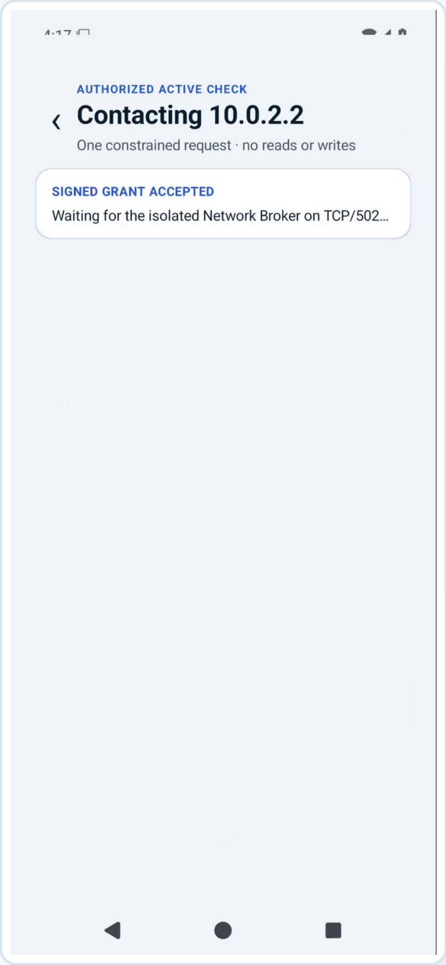
CUSTOMER BENEFIT **The result is a current baseline the customer can explain to operations, security and management.**

Step 4 — close one remaining gap without widening the scope

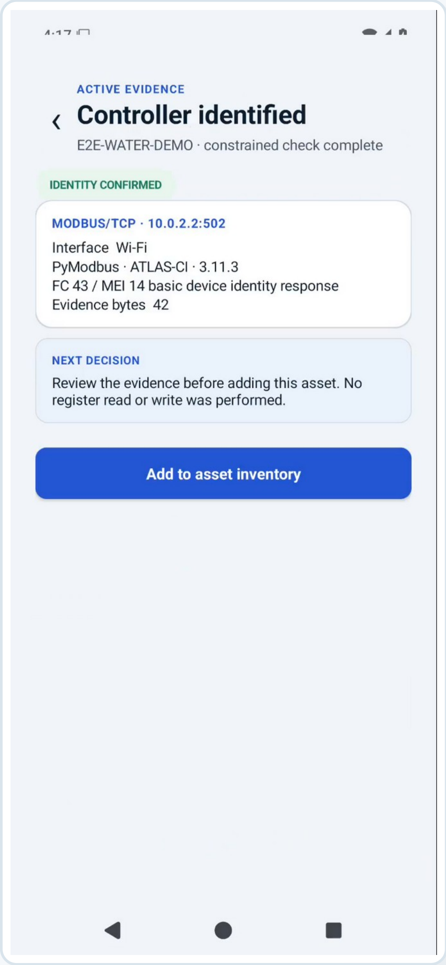
Active behavior is optional and exact. The workflow shows why the request is needed, what target is authorized and what is prohibited.



Exact work order and target



Out-of-scope target blocked



One controller identified

SAFETY AS A BENEFIT

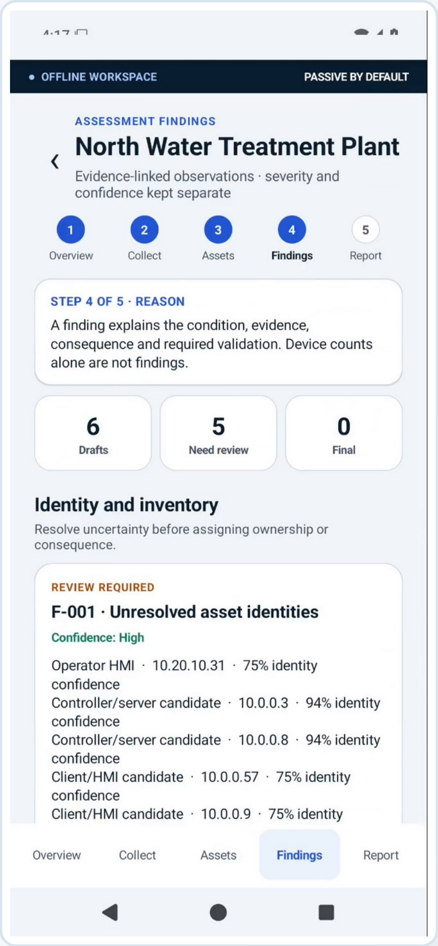
The application guides the operator through a bounded identity check — and rejects a target that falls outside the authorized CIDR.

- One exact target
- One identity request
- No scan · no write

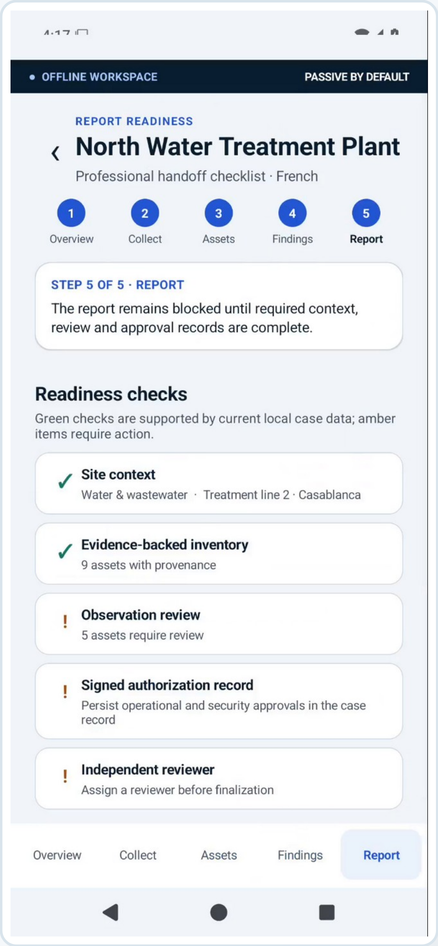
CUSTOMER BENEFIT The customer can resolve a specific uncertainty without turning the appliance into a general-purpose scanner.

Step 5 — the handoff says what is ready and what is not

The assessment ends with evidence-linked findings and explicit readiness blockers — not an overconfident “all clear.”



Evidence-linked finding



Report-readiness gate

HANDOFF

What we established	Reviewed inventory and evidence-backed identity claims.
What needs action	Findings with condition, evidence, confidence and recommendation.
What remains uncertain	Unreviewed evidence, incomplete approvals or visibility limitations.

CUSTOMER BENEFIT **The customer leaves with a defensible action list instead of a pile of scan output.**

What changes for the customer after the guided assessment

The benefit is not another tool in the toolbox. It is a better operating state that can be repeated.

BEFORE

“We have an inventory.”

But confidence depends on age, spreadsheets and tribal knowledge.

uncertainty

WITH ATLAS

“We can show the evidence.”

Expected, observed and confirmed identities live in one guided review flow.

defensible progress

AFTER

“We know what to do next.”

Unknowns, conflicts, findings and blockers remain explicit and reviewable.

defensible progress

CUSTOMER BENEFIT **Atlas helps the customer move from “inventory as a document” to “inventory as an evidence-backed operational picture.”**

What exists today — and what the free pilot is meant to prove

We separate demonstrated software behavior from the field qualification that must happen with a real customer.

DEMONSTRATED TODAY

Guided Android workflow	Scope → collect → review → findings → report readiness
Passive capture/import	Bounded PCAP/PCAPNG analysis and receive-only capture path
Evidence reasoning	Provenance, confidence, conflicts and analyst acceptance
Bounded active identity	One exact Modbus/TCP device-identification request
CI proof	API 29/35 UI journeys and emulator / virtual-SPAN tests

PROVED WITH THE PILOT

Physical field fit	Phone / appliance / USB-Ethernet / SPAN-TAP behavior in the customer environment
Operational usefulness	Does the workflow reduce uncertainty for the customer's real team?
Evidence quality	Is the collected evidence sufficient for the chosen process segment?
Handoff fit	Does the output support the customer's review and remediation process?
Adoption decision	Is the appliance valuable enough to acquire and keep?

CUSTOMER BENEFIT **The free pilot is not a sales demo. It is the customer's evidence for the acquisition decision.**

No production qualification is claimed before the field pilot and release gates are completed

FREE PILOT

Start with one bounded segment
Then decide from your own experience.

What we ask from you

- One drinking-water or wastewater control segment
- A named operational/security sponsor and an agreed collection window
- Written scope, exclusions and stop conditions

WHAT HAPPENS NEXT

1. We deliver and configure the appliance
2. We guide the first assessment and leave it with you
3. You use it and judge the value in your own environment
4. **Acquire it — or tell us to pick it up**
5. Add consulting/support only where it helps

The next decision is only: which bounded segment should we use for the free pilot?
